

In this assignment, I will be writing about the TA Finance company's expansion. I will use Cisco packet tracer software to build and establish this company's network, as well as assign all IP addresses and ensure full connectivity. For task one, I will set up the physical topology and use subnetting to ensure that the network has the correct IPv4 address. I will also provide ping results based on the criteria. I will explore and show how DHCP can improve the functionality of task one's implementation in task two. In addition, I will use DHCP configuration on the router to automatically assign IP addressing to the devices in the admin, accounting, management, sales, and wireless areas.

Task one

Network Configuration and Ping Results

The table below shows all the IP addressing (and range of IP addressing) allocated.

Name Of Device	Interface	IP address (Range)	Subnet Mask	Default Gateway
PC (Admin) x20 Printer0	NIC/Fa0	10.26.0.3/24 - 10.26.0.23/24	255.255.255.0	10.26.0.1
PC (Accounting) x35	NIC/Fa0	10.26.0.24/24 - 10.26.0.59/24	255.255.255.0	10.26.0.1
PC (Sales) x60	NIC/Fa0	10.26.0.60/24 - 10.26.0.120/24	255.255.255.0	10.26.0.1
Router (Awais router)	GigabitEthernet0/0	10.26.0.1/24	255.255.255.0	N/A
	GigabitEthernet0/1	10.26.1.1/27	255.255.255.224	N/A
	GigabitEthernet0/2	10.26.2.1/24	255.255.255.0	N/A
	Serial0/3/0	10.26.3.1/30	255.255.255.252	N/A
Switch (Hussain switch)	GigabitEtherner0/1 VLAN1	10.26.0.2/24	255.255.255.0	10.26.0.1
Switch (switch 1)	GigabitEthernet0/1 VLAN2	10.26.2.2/24	255.255.255.0	10.26.2.1
Laptop0	Wireless connection	10.26.2.3/24	255.255.255.0	10.26.2.1
SmartPhone	Wireless connection	10.26.2.4/24	255.255.255.0	10.26.2.1
DNS Server	NIC/Fa0	10.26.1.2/27	255.255.255.224	10.26.1.1
Cloud storage	NIC/Fa0	88.44.22.2/30	255.255.255.252	88.44.22.1
ISP Router	Serial0/3/0	10.26.3.2/30	255.255.255.252	10.26.3.1
	GigabitEthernet0/0	88.44.22.1/30	255.255.255.252	88.44.22.1

Awais Hussain

Awaits Router Show Run:

The image displays two side-by-side screenshots of the Cisco Packet Tracer interface, specifically the 'CLI' (Command Line Interface) tab for a router named 'Awais'.

Left Screenshot: The router is in User Access Verification mode. The user enters 'enable' to enter privileged EXEC mode. Then, the user enters 'show run' to display the current configuration. The output shows the current configuration, including the version (15.1), service timestamps, service password-encryption, hostname 'Awais', enable secret, and enable password.

Right Screenshot: The router is in privileged EXEC mode. The user enters 'configure terminal' to enter global configuration mode. The user then enters a series of commands to configure the router: 'interface GigabitEthernet0/0', 'ip address 10.26.0.1 255.255.255.0', 'duplex auto', 'speed auto', 'interface GigabitEthernet0/1', 'ip address 10.26.1.1 255.255.255.224', 'duplex auto', 'speed auto', 'interface GigabitEthernet0/2', 'ip address 10.26.2.1 255.255.255.0', 'duplex auto', 'speed auto', 'interface Serial0/3/0', 'ip address 10.26.3.1 255.255.255.0', 'interface Serial0/3/1', 'no ip address', 'clock rate 2000000', 'shutdown', 'interface Vlan1', 'no ip address', 'shutdown', 'router rip', 'version 2', 'network 10.0.0.0', 'ip classless', 'ip flow-export version 9', 'no cdp run', 'line con 0', 'password 7 0822455D0A16', 'login', 'line aux 0', 'line vty 0 4', 'login', and 'end'.

The image displays two side-by-side screenshots of the Cisco Packet Tracer CLI for an ISP Router. The left window shows the initial configuration steps: User Access Verification, enabling secret and password encryption, setting the hostname to ISP_Router, enabling secret and password encryption, and setting the license. The right window shows the configuration of interfaces: GigabitEthernet0/0, GigabitEthernet0/1, GigabitEthernet0/2, Serial0/3/0, Serial0/3/1, and Vlan1, all configured with IP addresses and clock rates. The configuration also includes router rip, ip classless, ip flow-export version 9, and line con 0, line aux 0, and line vty 0 4.

Task two

How DHCP can improve the functionality.

Prior to getting into the technical aspects of DHCP, let us start by defining what IP addressing is and why it holds such immense importance in the accessing of the internet. A device connected to the internet, or a local network is identified by its IP address, which is a unique address. The Internet Protocol (IP) is a collection of rules that regulate the format of data transferred over the internet or a local network. IP addresses, essentially, are the identifiers that allow data to be transmitted between devices on a network. They contain location information and make devices reachable for communication. The internet requires a method of distinguishing between various computers, routers and more. IP addresses are a useful way to accomplish this, and because of this reason the need for IP addressing is highlighted as it holds such importance. [1]

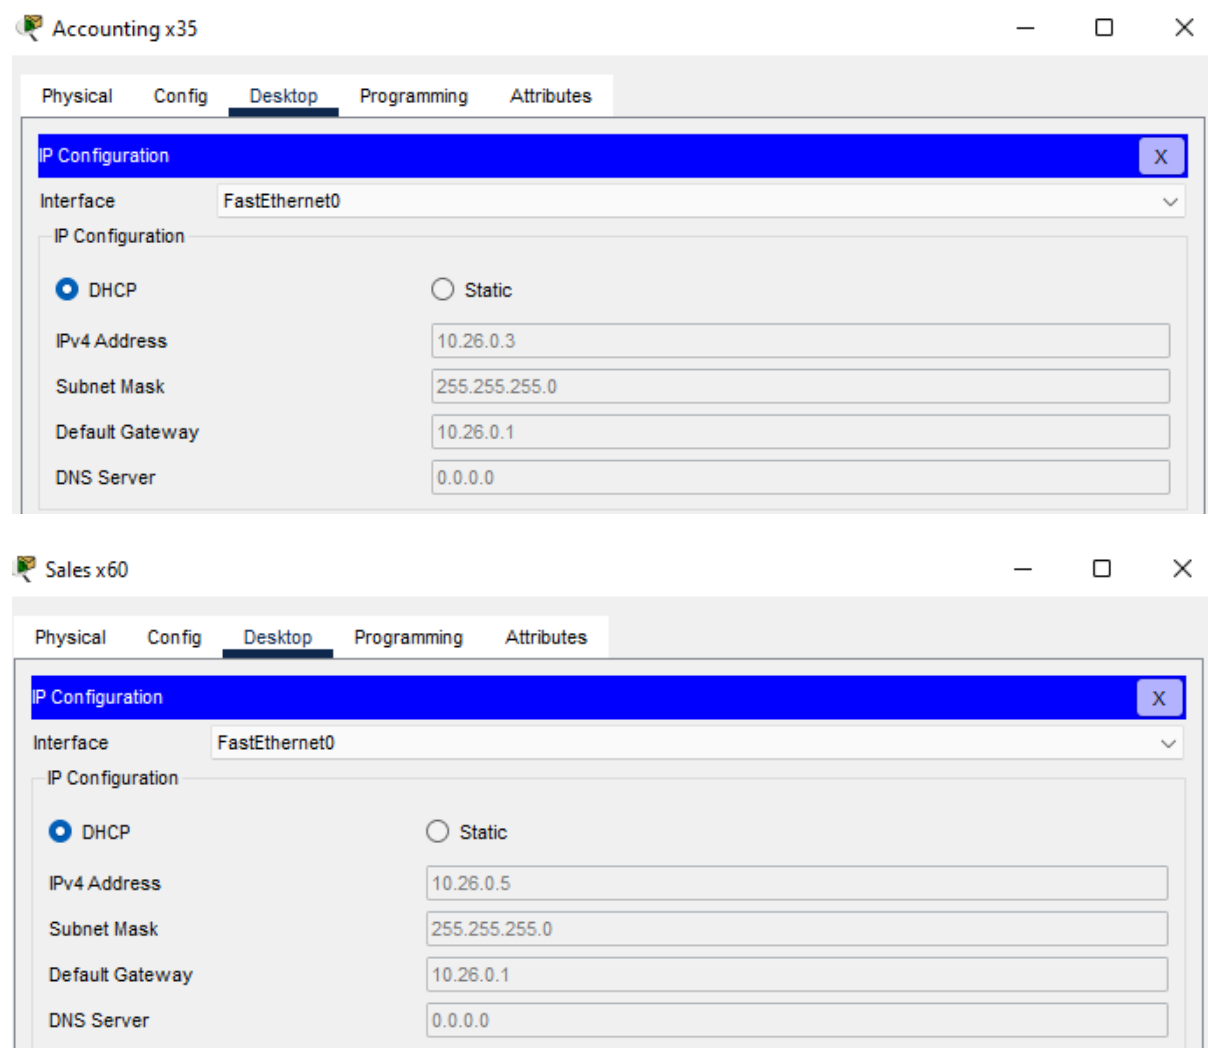

So, as we are informed on what an IP address is, we can now question about what DHCP can do to enhance the functionality of the TA Finance company's expansion implementation? First and foremost, what is DHCP and what does it achieve? The Dynamic Host Configuration Protocol (DHCP) is a mechanism that automates the distribution of IP addresses to fixed and mobile hosts that are both wired and wirelessly connected. When a device wants to connect to a DHCP server network, it sends a request for an IP address, and the DHCP server then responds. The server responds to the request by assigning an IP address to the device, then monitoring its usage and returning the address after a certain period of time or when the device shuts down. The IP address is then returned to the pool of addresses on the DHCP server, where it will be assigned to another device requesting network access. While the protocol's primary purpose is to provide IP addresses, it also assigns subnet masks, default gateway addresses, and domain name server addresses (DNS). The earlier BOOTP (bootstrap protocol) has become outdated and due to this it only works on IPv4 networks, therefore DHCP is an IEEE standard developed on top of it. [3]

How can DHCP improve the functionality of the implementation of the TA Finance company's expansion now that we know what it is and what it does? Well, increasing reliability is one of the ways it can increase functionality. Some devices can wind up with the same IP address due to human error, and the fact is that two people cannot utilize the same IP address [4]. This is caused by a conflict between both devices, which implies that in this circumstance, one or both users will be unable to connect to the network if this problem were to occur. The DHCP eliminates the potential of human error and keeps the server running smoothly, thus enhancing the network functionality. Not only that, but because DHCP does more than just assign addresses, the IP addresses are optimized as well. Additionally, it also automatically takes the addresses back and returns them to the pool when the user is no longer using them. Furthermore, another significant benefit of utilizing the DHCP to acknowledge is the ability to control the lease time of the IP addresses. As the DHCP does not assign addresses indefinitely, it is static rather than dynamic. Static addresses are useful for some devices, such as network printers. The DHCP protocol, on the other hand, assigns a lease time to each address assigned by the DHCP server. Once the lease has ended, the client can no longer use

the IP address and it is effectively evicted from the network. The protocol is set up so that active clients automatically contact the DHCP server halfway through their lease period to renew their lease. If the server does not answer fast enough, the client will keep requesting for a lease renewal from the DHCP server until one is granted. When a host goes down, the lease is usually promptly cancelled to provide room for another client on the network in order to utilize the IP address. I believe that by applying this IP leasing process, the network will undoubtedly run smoother as it will reduce the traffic consequently increasing the functionality. [2]

Ultimately, there are numerous pros to using DHCP. The factors mentioned above was just a handful of the substantial number of benefits, thus signifying the importance of implementing the DHCP in regard to letting the network reach its full potential of functionality and effectiveness for the network implementation. You might question 'Which protocol is better? DHCP or BOOTP?' The simple answer to this is DHCP. The DHCP is better choice to implemented due to the simple fact that there is mobile connection in this implementation whereas BOOTP does not support mobile connection. Therefore, this will limit the functionality more than improve the functionality in this case, making DHCP the superior protocol to be executed.
